RAILROAD VALLEY COMPANY'S OUTLOOK

(Continued from Page 1)

soda and borax that may be recovered therefrom, are at least partly established. The total is much greater than the original governmental estimate. It is the opinion of E. Free, our engineer, and of other qualified chemists, that the technical questions involved in the economical manufacture of potash, soda and borax will be successfully solved, although this may still require months or years. If this opinion is correct, Seares lake will ultimately produce several million dollars per annum of potash, soda and borax, over a life history of possibly 30 years or more.

Open February 1st, 1915, I filed in the general land office at Washington, D. C., a formal protest against the California Trona company's application for patent upon three lots of land aggregating 1200 acres. These applications our counsel believe are not cases designed to promote the attempt of the California Trona company to obtain title to all of the valuable deposit, except that which is embraced within the borax company's patented land. In this protest, as a citizen of the United States, I maintain that the Trona company's alleged claims are fraudulent and void and request that a public hearing be granted before the general land office reaches a decision in this matter. The hearing will be given, probably within the next four months.

Nearly two and one-half years ago Hugh H. Brown, our counsel, investigated the legal situation and gave the opinion that the alleged Trona titles were worthless and would not be sustained in the general land office. The largest orebody in the Goldfield district was disclosed by a diamond drill and today this ledge is yielding almost as much as in the early days of 1906 when the drill placed the Laguna on the map as the possessor of one of the largest known orebodies. The effect of the report on the fortunes of the Laguna was instantaneous, as the stock jumped in course of a week from a few cents to \$2 per share. That the drill was an accurate index in bringing from a depth of 700 feet some of the best values known to exist outside of the then famous Mohawk and Red Top cannot be denied, as the Laguna still continues to produce up to the first of January, 1915, according to the annual report of the Goldfield Consolidated Mines company, yielded approximately \$7,500,000. Other drill prospectors went over the ground of the Grandma and Blue Bell, but they sank to comparatively shallow depths and failed to reach the orebodies which subsequent development in adjoining properties indicated would be found there. The work was abandoned for want of funds and no other attempts were made to test the merits of the core drills.

The system of drilling is to begin with one or more exploratory holes which will serve as a guide to later work. In case a ledge is discovered the drills then are kept along certain lines on both sides of the center until the operators feel they have thoroughly sampled the areas under contract. The drills have a capacity for sinking to 2000 feet at the rate of 15 to 20 feet every 24 hours when three shifts are worked. The drillers assume all the risks of failure, as their compensation depends on locating an orebody, and, when it is understood that the sinking is estimated to cost anywhere from one to two dollars per foot, the company demonstrates its confidence in the resources of Goldfield when it expresses a willingness to go ahead as soon as contracts are signed.

POPE'S BROTHER DEAD

(By Associated Press.)

LONDON, April 13.—The Marquis Jules Della Chiesa, a brother of Pope Benedict, is dead, according to Reuters' Genoa correspondent.

A LATE ARRIVAL

The wife of J. P. Montague presented him with a handsome baby boy this morning, the second to arrive.

TEMPERATURE REPORT

Highest temperature yesterday, 70; a year ago, 64.

Lowest temperature last night, 29; a year ago, 50.

IRVING McDONALD, a pioneer mining engineer of Tonopah, arrived this morning from Oakland.
